streptokinase precursor - Streptococcus "equisimilis"

()Species: Streptococcus "equisimilis"

C)Accession: A22801

C)Accession: A22801

R)Malke, H.; Roe, B.; Ferretti, J.J.

Gene 34, 357-362, 1985

A;Title: Nucleotide sequence of the streptokinase gene from Streptococcus equisimilis H.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A;Accession: A22801

                                                                                                                                                                                                                                                                                                                                                                                       streptococc
                                                                                                                                                                                                                                                                                                                                                                                                                  streptococc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Biochemistry 21:6620-6625(1982).

-I- FUNCTION: This protein is not a protease, but it activates plasminogen by complexing with it. As a potential virulence factor, it is thought to prevent the formation of effective fibrin barriers around the site of infection, thereby contributing to the invasiveness of the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE-83127125; PubMed-6760891;

Nucleic Acids Res. 17:1262-1262 [1989].

-!- FUNCTION: This proces in not a protease, but it activates plasminogen by complexing with it. As a potential virulence factor, it is thought to prevent the formation of effective barriers around the site of infection, thereby contributing invasiveness of the cells. [1]

NUCLEOTIDE SEQUENCE [GENOMIC DNA].

"Complete genome sequence of an M1 strain of Streptococcus pyogenes.";

Proc. Natl. Acad. SG1. U.S.A. 98:4653 (2001).

"I - FUNCTION: This protein is not a protease, but it activates plasminogen by complexing with it. As a potential virulence factor, it is thought to prevent the formation of effective fibrin barriers around the site of infection, thereby contributing to the invasiveness of the cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This Swiss-Prot entry is copyright. The -35 and -10 regions are located at positions 760-765 and 781-786 respectively and an SD sequence at 808-813. Downstream from the coding region inverted repeats (positions 2176-2190 and 2203-2217) are thought to function as transcription terminators. The nucleotide sequence of skc does not support the hypothesis that the gene has evolved by duplication and fusion, as suggested by internal two-fold AA homologies of its product.
